

ABSTRACT

The video camera apparatus and image sensing method are capable of obtaining a still image without blurring even when a moving object is picked up with use of a solid image sensor capable of progressive scanning. An electronic shutter of a CCD image sensor 23 capable of outputting an image sensing signal in a progressive scan mode is controlled by a timing signal generator 28, with the field cycle according to the standard television system used as a basic cycle, to cause the CCD image sensor 23 to output an image sensing signal in the progressive scan mode.
